

MCQ

B.7.5. Ventricular Arrhythmias

1. The delta wave sometimes seen on an ECG indicates the presence of:
 - a) An extra AV node in the heart
 - b) An additional bundle connecting the right atrium to the left atrium
 - c) An extra bundle connecting the right ventricle to the left ventricle
 - d) An additional bundle connecting the atrium to the ventricle

2. The major difference on the ECG between an atrial extrasystole and a ventricular systole is:
 - a) The shape of the P wave
 - b) The shape of the QRS wave
 - c) The shape of the T wave
 - d) The shape of the QRS and the T wave

3. When there are no visible waves on an ECG, this could indicate:
 - a) Atrial fibrillation
 - b) Ventricular fibrillation
 - c) Ventricular tachycardia
 - d) Ventricular extrasystole

4. Which arrhythmia is the deadliest?
 - a) Atrial fibrillation
 - b) Ventricular fibrillation
 - c) Ventricular tachycardia
 - d) Ventricular extrasystole

Answers:

- 1) d.
- 2) d.
- 3) b.
- 4) b.
